

## CSCI 2021, Fall 2017

## Architecture Lab: Optimizing the Performance of a Pipelined Processor

Assigned: Oct 27, **Due: Nov 18, 11:55PM**

## 1 Introduction

In this lab, you will learn about the design and implementation of a pipelined Y86-64 processor, optimizing both it and a benchmark program to maximize performance. You are allowed to make any semantics-preserving transformation to the benchmark program, to make enhancements to the pipelined processor, or both. When you have completed the lab, you will have a keen appreciation for the interactions between code and hardware that affect the performance of your programs.

The lab is organized into three parts, each with its own hand-in. In Part (A) you will write some simple Y86-64 programs and become familiar with the Y86-64 tools. In Part (B), you will extend the SEQ simulator with a new instruction. These two parts will prepare you for Part (C), the heart of the lab, where you will optimize the Y86-64 benchmark program and the processor design.

## 2 Logistics

This is an individual project. All hand-ins are electronic. Clarifications and corrections will be posted on the course message board.

## 3 Handout Instructions

Go to the Moodle site to download the `archlab-handout.tar` file.

1. Start by copying the file `archlab-handout.tar` to a (protected) directory in which you plan to do your work.
2. Then give the command: `tar xvf archlab-handout.tar`. This will cause the following files to be unpacked into the directory: `README`, `Makefile`, `sim.tar`, `archlab.pdf`, and `simguide.pdf`.
3. Next, give the command `tar xvf sim.tar`. This will create the directory `sim`, which contains your personal copy of the Y86-64 tools. You will be doing all of your work inside this directory.
4. Finally, change to the `sim` directory and build the Y86-64 tools:  

```
unix> cd sim  
unix> make clean; make
```

## 4 Part A

You will be working in directory `sim/misc` in this part.

Your task is to write and simulate the following two Y86-64 programs. The required behavior of these programs is defined by the example C functions in `examples.c`. **Be sure to put your name and ID in a comment at the beginning of each program.** You can test your programs by first assembling them with the program YAS and then running them with the instruction set simulator YIS.

In all of your Y86-64 functions, you should follow the x86-64 conventions for passing function arguments, using registers, and using the stack. This includes saving and restoring any callee-save registers that you use.

### **`sum.y`: Iteratively sum linked list elements**

Write a Y86-64 program `sum.y` that iteratively sums the elements of a linked list. Your program should consist of some code that sets up the stack structure, invokes a function, and then halts. In this case, the function should be Y86-64 code for a function (`sum_list`) that is functionally equivalent to the C `sum_list` function in Figure 1. Test your program using the following three-element list:

```
# Sample linked list
.align
8 ele1:
    .quad 0xa00
    .quad ele2
ele2:
    .quad 0x0b0
    .quad ele3
ele3:
    .quad 0x00c
    .quad 0
```

### **`copy.y`: Copy a source block to a destination block**

Write a program (`copy.y`) that copies a block of words from one part of memory to another (non-overlapping area) area of memory, computing the checksum (XOR) of all the words copied.

Your program should consist of code that sets up a stack frame, invokes a function `copy_block`, and then halts. The function should be functionally equivalent to the

C function `copy_block` shown in Figure 1. Test your program using the following three-element source and destination blocks:

```
.align 8
# Source
block src:
    .quad 0x001
    .quad 0x002
    .quad 0x004

# Destination
block dest:
    .quad 0x111
    .quad 0x222
    .quad 0x333
```

---

```
1 /* linked list element */
2 typedef struct ELE {
3     long val;
4     struct ELE *next;
5 } *list_ptr;
6
7 /* sum_list - Sum the elements of a linked list */
8 long sum_list(list_ptr ls)
9 {
10     long val = 0;
11     while (ls) {
12         val += ls->val;
13         ls = ls->next;
14     }
15     return val;
16 }
17
18 . . .
19
30 /* copy_block - Copy src to dest and return xor checksum of src */
31 long copy_block(long *src, long *dest, long len)
32 {
33     long result = 0;
34     while (len > 0) {
35         long val = *src++;
36         *dest++ = val;
37         result ^= val;
38         len--;
39     }
40     return result;
41 }
```

Figure 1: C versions of the Y86-64 solution functions. See `sim/misc/examples.c`

Here is an example C function that contains a simple if-statement. Below, it is rewritten using Y86-64 commands. Your `sum.y8` and `copy.y8` files should look similar to this example. See section 4.1 in the textbook for more examples.

---

```
int example (int x, int y) {
    if (x < y) {
        x = x - 8;
    }
    else {
        y = y + 8;
    }
    return 2 * x + y;
}
```

---

```

    .pos 0
    irmovq stack, %rsp
    call main
    halt

main:
    irmovq 1, %rdi
    irmovq 2, %rsi
    call example                #example(1, 2)
    return

# int example(int x, int y)
# x in %rdi, y in %rsi

example:
    irmovq $8, %r8              # Store constant 8 in %r8
    rrmovq %rsi, %r9            # Store y in %r9
    subq %rdi, %r9              # y - x
    jge L2                      # jump to L2 if y >= x
    subq %r8, %rdi              # x = x - 8
    jmp L3

L2:
    addq %r8, %rsi              # y = y + 8

L3:
    addq %rdi, %rdi              # x = 2 * x
    rrmovq %rdi, %rax           # ret_value = 2 * x
    addq %rsi, %rax             # ret_value = 2 * x + y
    ret

    .pos 0x200
stack:
```

---

## 5 Part B

You will be working in directory `sim/seq` in this part.

Your task in Part B is to extend the SEQ processor to support a new instruction `iaddq`. To add this instruction, you will modify the file `seq-full.hcl`, which implements the version of SEQ described in the CS:APP3e textbook. In addition, it contains declarations of some constants that you will need for your solution.

Your HCL file must begin with a header comment containing the following information:

- Your name and ID Number
- A description of the computations required for the `iaddq` instruction. Use the descriptions of `irmovq` and `OPq` in Figure 4.18 in the textbook as a guide.

### Building and Testing Your Solution

Once you have finished modifying the `seq-full.hcl` file, then you will need to build a new instance of the SEQ simulator (`ssim`) based on this HCL file, and then test it:

- *Building a new simulator.* You can use `make` to build a new SEQ simulator:

```
unix> make
```

This builds a version of `ssim` that uses the control logic you specified in `seq-full.hcl`

- *Testing your solution on a simple Y86-64 program.* For your initial testing, we recommend running simple programs such as `asumi.yo` (testing `iaddq`) in TTY mode, comparing the results against the ISA simulation:

```
unix> ./ssim -t ../y86-code/asumi.yo
```

If the ISA test fails, then you should debug your implementation by single stepping the simulator in GUI mode:

```
unix> ./ssim -g ../y86-code/asumi.yo
```

This will run `ssim` on the benchmark programs and check for correctness by comparing the resulting processor state with the state from a high-level ISA simulation. Note that none of these programs test the added instructions. You are simply making sure that your solution did not inject errors for the original instructions. See file `../y86-code/README` file for more details.

- *Performing regression tests.* Once you can execute the benchmark programs correctly, then you should run the extensive set of regression tests in `../ptest`. To test everything except `iaddq`:

```
unix> (cd ../ptest; make SIM=../seq/ssim)
```

To test your implementation of `iaddq`:

```
unix> (cd ../ptest; make SIM=../seq/ssim TFLAGS=-i)
```

For more information on the SEQ simulator refer to the handout *CS:APP3e Guide to Y86-64 Processor Simulators* (`simguide.pdf`).

## 6 Part C

You will be working in directory `sim/pipe` in this part.

The `ncopy` function in Figure 2 copies a `len`-element integer array `src` to a non-overlapping `dst`, returning a count of the number of negative integers contained in `src`. Figure 3 shows the baseline Y86-64 version of `ncopy`. The file `pipe-full.hcl` contains a copy of the HCL code for PIPE, along with a declaration of the constant value `IIADDQ`.

---

```

1 /*
2  * ncopy - copy src to dst, returning number of negative ints
3  * contained in src array.
4  */
5 word_t ncopy(word_t *src, word_t *dst, word_t len)
6 {
7     word_t count = 0;
8     word_t val;
9
10    while (len > 0) {
11        val = *src++;
12        *dst++ = val;
13        if (val < 0)
14            count++;
15        len--;
16    }
17    return count;
18 }
```

Figure 2: **C version of the `ncopy` function.** See `sim/pipe/ncopy.c`.

---

Your task in Part C is to modify `ncopy.y` and `pipe-full.hcl` with the goal of making `ncopy.y` run as fast as possible.

You will be handing in two files: `pipe-full.hcl` and `ncopy.hs`. Each file should begin with a header comment with the following information:

- Your name and ID Number
- A high-level description of your code. In each case, describe how and why you modified your code.

## Coding Rules

You are free to make any modifications you wish, with the following constraints:

- Your `ncopy.hs` function must work for arbitrary array sizes. You might be tempted to hardwire your solution for 64-element arrays by simply coding 64 copy instructions, but this would be a bad idea because we will be grading your solution based on its performance on arbitrary arrays.
- Your `ncopy.hs` function must run correctly with YIS. By correctly, we mean that it must correctly copy the `src` block *and* return (in `%rax`) the correct number of negative integers.
- The assembled version of your `ncopy` file must not be more than 1000 bytes long. You can check the length of any program with the `ncopy` function embedded using the provided script `check-len.pl`:

```
unix> ./check-len.pl < ncopy.yo
```

- Your `pipe-full.hcl` implementation must pass the regression tests in `../y86-code` and `../ptest` (without the `-i` flag that tests `iaddq`).

Other than that, you are free to implement the `iaddq` instruction if you think that will help. You may make any semantics preserving transformations to the `ncopy.hs` function, such as reordering instructions, replacing groups of instructions with single instructions, deleting some instructions, and adding other instructions. You may find it useful to read about loop unrolling in Section 5.8 of CS:APP3e.

## Building and Running Your Solution

In order to test your solution, you will need to build a driver program that calls your `ncopy` function. We provided you with the `gen -driver.pl` input program that generates a driver program for arbitrary sized arrays. For example, typing

```
unix>      make drivers
```

will construct the following two useful driver programs: (Continued p. 9)

```
#####

2 # ncopy.ys - Copy a src block of len words to dst.
3 # Return the number of negative words (<0) contained in src.
4 #
5 # Include your name and ID here.
6 #
7 # Describe how and why you modified the baseline code.
8 #
9 #####
10 # Do not modify this portion
11 # Function prologue.
12 # %rdi = src, %rsi = dst, %rdx = len
13 ncopy:
14
15 #####
16 # You can modify this portion
17     # Loop header
18     xorq %rax,%rax           # count = 0;
19     andq %rdx,%rdx           # len <= 0?
20     jle Done                 # if so, goto Done:
21
22 Loop:  mrmovq (%rdi), %r10     # read val from src...
23         rmmovq %r10, (%rsi)    # ...and store it to dst
24         andq %r10, %r10        # val > 0?
25         jg Npos                # if so, goto Npos:
26         irmovq $1, %r10        # count++
27         addq %r10, %rax
28 Npos:  irmovq $1, %r10
29         subq %r10, %rdx        # len--
30         irmovq $8, %r10
31         addq %r10, %rdi        # src++
32         addq %r10, %rsi        # dst++
33         andq %rdx,%rdx        # len > 0?
34         jg Loop                # if so, goto Loop:
35 #####
36 # Do not modify the following section of code
37 # Function epilogue.
38 Done:
39     ret
40 #####
41 # Keep the following label at the end of your function
42 End:
```

Figure 3: **Baseline Y86-64 version of the ncopy function.** See `sim/pipe/ncopy.ys`.

- `sdriver.yo`: A *small driver program* that tests an `ncopy` function on small arrays with 4 elements. If your solution is correct, then this program will halt with a value of 2 in register `%rax` after copying the `src` array.
- `ldriver.yo`: A *large driver program* that tests an `ncopy` function on larger arrays with 63 elements. If your solution is correct, then this program will halt with a value of 32 (0x20) in register `%rax` after copying the `src` array

Each time you modify your `ncopy.yo` program, you can rebuild the driver programs by typing

```
unix>make drivers
```

Each time you modify your `pipe-full.hcl` file, you can rebuild the simulator by typing

```
unix>make psim
```

If you want to rebuild the simulator and the driver programs, type

```
unix>make
```

To test your solution in GUI mode on a small 4-element array, type

```
unix>./psim -g sdriver.yo
```

To test your solution on a larger 63-element array, type

```
unix>./psim -g ldriver.yo
```

Once your simulator correctly runs your version of `ncopy.yo` on these two block lengths, you will want to perform the following additional tests:

- *Testing your driver files on the ISA simulator.* Make sure that your `ncopy.yo` function works properly with YIS:

```
unix> make drivers
unix> ../misc/yis sdriver.yo
```

- *Testing your code on a range of block lengths with the ISA simulator.* The Perl script `correctness.pl` generates driver files with block lengths from 0 up to some limit (default 65), plus some larger sizes. It simulates them (by default with YIS), and checks the results. It generates a report showing the status for each block length:

```
unix> ./correctness.pl
```

This script generates test programs where the result count varies randomly from one run to another, and so it provides a more stringent test than the standard drivers.

If you get incorrect results for some length  $K$ , you can generate a driver file for that length that includes checking code, and where the result varies randomly:

```

unix> ./gen-driver.pl -f ncopy.ys -n K -rc > driver.ys
unix> make driver.yo
unix> ../misc/yis driver.yo

```

The program will end with register `%rax` having the following value:

**0xaaaa** : All tests pass.  
**0xbbbb** : Incorrect count.  
**0xcccc** : Function `ncopy` is more than 1000 bytes long.  
**0xdddd** : Some of the source data was not copied to its destination.  
**0xeeee** : Some word just before or just after the destination region was corrupted.

- *Testing your pipeline simulator on the benchmark programs.* Once your simulator is able to correctly execute `sdriver.ys` and `ldriver.ys`, you should test it against the Y86-64 benchmark programs in `../y86-code`:

```

unix> (cd ../y86-code; make testpsim)

```

This will run `psim` on the benchmark programs and compare results with YIS.

- *Testing your pipeline simulator with extensive regression tests.* Once you can execute the benchmark programs correctly, then you should check it with the regression tests in `../ptest`. For example, if your solution implements the `iaddq` instruction, then

```

unix> (cd ../ptest; make SIM=../pipe/psim TFLAGS=-i)

```

- *Testing your code on a range of block lengths with the pipeline simulator.* Finally, you can run the same code tests on the pipeline simulator that you did earlier with the ISA simulator

```

unix> ./correctness.pl -p

```

## 7 Evaluation

The lab is worth 150 points: 30 points for Part A, 30 points for Part B, and 90 points for Part C.

### Part A

Part A is worth 30 points, 15 points for each Y86-64 solution program. Each solution program will be evaluated for correctness, including proper handling of the stack and registers, as well as functional equivalence with the example C functions in `examples.c`.

The program `sum.ys` will be considered correct if the graders do not spot any errors in them, and the `sum_list` function returns the sum `0xabc` in register `%rax`.

The program `copy.ys` will be considered correct if the graders do not spot any errors in it, and the `copy_block` function returns the sim `0x007` in register `%rax`, copies the three 64-bit

values `0x001`, `0x002`, and `0x004` to the 24 bytes beginning at address `dest`, and does not corrupt other memory locations.

## Part B

This part of the lab is worth 30 points:

- 10 points for your description of the computations required for the `iaddq` instruction.
- 10 points for passing the benchmark regression tests in `y86-code`, to verify that your simulator still correctly executes the benchmark suite.
- 10 points for passing the regression tests in `pctest` for `iaddq`.

## Part C

This part of the Lab is worth 90 points: **You will not receive any credit if either your code for `ncopy.js` or your modified simulator fails any of the tests described earlier.**

- 15 points *each* for your description in the headers of `ncopy.js` and `pipe-full.hcl` and the quality of these implementations.
- 60 points for performance. To receive credit here, your solution must be correct, as defined earlier. That is, `ncopy` runs correctly with `YIS`, and `pipe-full.hcl` passes all tests in `y86-code` and `pctest`.

We will express the performance of your function in units of *cycles per element* (CPE). That is, if the simulated code requires  $C$  cycles to copy a block of  $N$  elements, then the CPE is  $C/N$ . The PIPE simulator displays the total number of cycles required to complete the program. The baseline version of the `ncopy` function running on the standard PIPE simulator with a large 63-element array requires 901 cycles to copy 63 elements, for a CPE of  $901/63 = 14.30$ .

```
unix> ./benchmark.pl
```

to see what happens. For example, the baseline version of the `ncopy` function has CPE values ranging between 33.00 and 14.27, with an average of 15.34. Note that this Perl script does not check for the correctness of the answer. Use the script `correctness.pl` for this.

You should be able to achieve an average CPE of less than 9.00. Our best version averages 7.61. If your average CPE is  $c$ , then your score  $S$  for this portion of the lab will be:

$$S = \begin{cases} 0, & c > 10.5 \\ 20 * (10.5 - c), & 7.65 \leq c < 10.5, \\ 60, & c < 7.65 \end{cases}$$

By default, `benchmark.pl` and `correctness.pl` compile and test `ncopy.js`. Use the `-f` argument to specify a different file name. The `-h` flag gives a complete list of the command line arguments.

## 8 Hand-in Instructions

You will need to submit all your solution files to the Moodle site directly. All the files should have your X500 as a prefix.

- You will be handing in three sets of files:
  - Part A: `sim/misc` folder should contain `sum.y`s and `copy.y`s files
  - Part B: `sim/seq` should contain the files `seq-full.hcl`.
  - Part C: `sim/pipe` should contain `ncopy.y`s and `pipe-full.hcl`.
- Make sure you have included your names and IDs in a comment at the top of each of your hand-in files.
- To name your files for part X, go to your `archlab-handout` directory and type:
 

```
unix> make handin-partX X500=your_x500_id
```

Where X is a, b, or c, and where X500 is your x500 ID. For example, to hand-in Part A:

```
unix> make handin-parta X500=suren009
```

- You can find your hand-in by looking in

```
./archlab-handout
```

Submit all of your files for all parts (A, B, and C) to Moodle directly at the end. You should submit 5 files (X500-sum.y, X500-copy.y, X500-seq-full.hcl, X500-ncopy.y, X500-pipe-full.hcl)

**Do NOT** submit X500-rsum.y

## 9 Hints

- By design, both `sdriver.yo` and `ldriver.yo` are small enough to debug with in GUI mode. We find it easiest to debug in GUI mode, and suggest that you use it.
- With some X servers, the “Program Code” window begins life as a closed icon when you run `psim` or `ssim` in GUI mode. Simply click on the icon to expand the window
- With some Microsoft Windows-based X servers, the “Memory Contents” window will not automatically resize itself. You’ll need to resize the window by hand.
- The `psim` and `ssim` simulators terminate with a segmentation fault if you ask them to execute a file that is not a valid Y86-64 object file.
